

Amplitude

100ms

The figure shows a red waveform on a white background. The waveform starts with a sharp vertical red line at the left edge. Following this, the signal remains at a low amplitude with small, irregular fluctuations. At approximately one-third of the way across the plot, the signal transitions into a more active state with higher-frequency, higher-amplitude noise. A thick black horizontal bar is positioned below the waveform, starting from the left edge and extending to the point where the signal becomes more active. The text '100ms' is centered above this black bar, indicating the duration of the time interval represented by the bar's length.
